1 Overview

This guide describes how to configure and use the Google Speech Recognition (GSR) plugin to the UniMRCP server. The document is intended for users having a certain knowledge of Google Cloud Speech Platform and UniMRCP.

1.1 Installation

For installation instructions, use one of the guides below.

- RPM Package Installation (Red Hat / Cent OS)
- Deb Package Installation (Debian / Ubuntu)

1.2 Applicable Versions

Instructions provided in this guide are applicable to the following versions.

UniMRCP 1.4.0 and above
UniMRCP GSR Plugin 1.0.0 and above

2 Supported Features

This is a brief check list of the features currently supported by the UniMRCP server running with the GSR plugin.

2.1 MRCP Methods

- ✓ DEFINE-GRAMMAR
- ✓ RECOGNIZE
- ✓ START-INPUT-TIMERS
- ✓ STOP
- ✓ SET-PARAMS
- ✓ GET-PARAMS

2.2 MRCP Events

- ✓ RECOGNITION-COMPLETE
- ✓ START-OF-INPUT

2.3 MRCP Header Fields

- ✓ Input-Type
- ✓ No-Input-Timeout
- ✓ Recognition-Timeout
- ✓ Waveform-URI
- ✓ Media-Type
- ✓ Completion-Cause
- ✓ Confidence-Threshold
- ✓ Start-Input-Timers
- ✓ DTMF-Interdigit-Timeout
- ✓ DTMF-Term-Timeout
- ✓ DTMF-Term-Char
- ✓ Save-Waveform
- ✓ Speech-Language
- ✓ Cancel-If-Queue
- ✓ Sensitivity-Level

2.4 Grammars

- ✓ Built-in and dynamic speech contexts
- ✓ Built-in/embedded DTMF grammar

2.5 Results

- ✓ NLSML

3 Configuration Format

The configuration file of the GSR plugin is located in `/opt/unimrcp/conf/umsgsr.xml`. The configuration file is written in XML.

3.1 Document

The root element of the XML document must be `<umsgsr>`.

Attributes

| Name | Unit | Description |
|------------------------------|-----------|---|
| license-file | File path | Specifies the license file. File name may include patterns containing '*' sign. If multiple files match the pattern, the most recent one gets used. |
| gapp-credentials-file | File path | Specifies the Google Application Credentials file to use. File name may include patterns containing '*' sign. If multiple files match the pattern, the most recent one gets used. |

Parent

None.

Children

| Name | Unit | Description |
|---|--------|---|
| <streaming-recognition> | String | Specifies parameters of streaming recognition employed via gRPC. |
| <speech-contexts> | String | Contains a list of speech contexts. |
| <speech-dtmf-input-detector> | String | Specifies parameters of the speech and DTMF input detector. |
| <utterance-manager> | String | Specifies parameters of the utterance manager. |
| <rdr-manager> | String | Specifies parameters of the Recognition Details Record (RDR) manager. |
| <monitoring-agent> | String | Specifies parameters of the monitoring manager. |

| | | |
|-------------------------------------|--------|--|
| <code><license-server></code> | String | Specifies parameters used to connect to the license server. The use of the license server is optional. |
|-------------------------------------|--------|--|

Example

This is an example of a bare document.

```
< umsgsr license-file="umsgsr_*.lic" gapp-credentials-file="*.json">
</ umsgsr>
```

3.2 Streaming Recognition

This element specifies parameters of streaming recognition.

Attributes

| Name | Unit | Description |
|-------------------------|---------|---|
| language | String | Specifies the default language to use, if not set by the client. For a list of supported languages, visit https://cloud.google.com/speech/docs/languages |
| interim-results | Boolean | Specifies whether to request interim results or not. |
| max-alternatives | Integer | Specifies the maximum number of speech recognition result alternatives to be returned. Can be overridden by client by means of the header field <i>N-Best-List-Length</i> . |
| single-utterance | Boolean | Specifies whether to detect a single spoken utterance or perform continuous recognition. Available since GSR 1.4.0 |

Parent

`<umsgsr>`

Children

None.

Example

This is an example of streaming recognition element.

```
<streaming-recognition
  interim-results="false"
  language="en-US"
  max-alternatives="1"
  single-utterance="true"
/>
```

3.3 Speech Contexts

This element specifies a list of speech contexts.

Availability

>= GSR 1.1.0.

Attributes

None.

Parent

<umsgsr>

Children

<speech-context>

Example

The example below defines two speech contexts *booking* and *directory*.

```
<speech-contexts>
  <speech-context id="booking" enable="true">
    <phrase>I would like to book a flight from New York to Rome with a ticket eligible for
free cancellation</phrase>
    <phrase>I would like to book a one-way flight from New York to Rome</phrase>
  </speech-context>

  <speech-context id="directory" enable="true">
    <phrase>call Steve</phrase>
    <phrase>call John</phrase>
    <phrase>dial 5</phrase>
    <phrase>dial 6</phrase>
  </speech-context>
</speech-contexts>
```

3.4 Speech Context

This element specifies a speech context, available since GSR 1.1.0.

Availability

>= GSR 1.1.0.

Attributes

| Name | Unit | Description |
|---------------|---------|---|
| id | String | Specifies a unique string identifier of the speech context to be referenced by the MRCP client. |
| enable | Boolean | Specifies whether the speech context is enabled or disabled. |

Parent

<speech-contexts>

Children

None.

Example

This is an example of speech context element.

```
<speech-context id="directory" enable="true">  
  <phrase>call Steve</phrase>  
  <phrase>call John</phrase>  
  <phrase>dial 5</phrase>  
  <phrase>dial 6</phrase>  
</speech-context>
```

3.5 Speech and DTMF Input Detector

This element specifies parameters of the speech and DTMF input detector.

Attributes

| Name | Unit | Description |
|-----------------|---------|--|
| vad-mode | Integer | Specifies an operating mode of VAD in the range of [0 ... 3]. Default is 1. Available since GSR 1.1.0. |

| | | |
|--------------------------------|----------------------|--|
| speech-start-timeout | Time interval [msec] | Specifies how long to wait in transition mode before triggering a start of speech input event. |
| speech-complete-timeout | Time interval [msec] | Specifies how long to wait in transition mode before triggering an end of speech input event. |
| noinput-timeout | Time interval [msec] | Specifies how long to wait before triggering a no-input event. |
| input-timeout | Time interval [msec] | Specifies how long to wait for input to complete. |
| dtmf-interdigit-timeout | Time interval [msec] | Specifies a DTMF inter-digit timeout. |
| dtmf-term-timeout | Time interval [msec] | Specifies a DTMF input termination timeout. |
| dtmf-term-char | Character | Specifies a DTMF input termination character. |
| speech-leading-silence | Time interval [msec] | Specifies desired silence interval preceding spoken input. |
| speech-trailing-silence | Time interval [msec] | Specifies desired silence interval following spoken input. |
| speech-output-period | Time interval [msec] | Specifies an interval used to send speech frames to the recognizer. |

Parent

<umsgsr>

Children

None.

Example

The example below defines a typical speech and DTMF input detector having the default parameters set.

```
<speech-dtmf-input-detector
  speech-start-timeout="300"
  speech-complete-timeout="1000"
  noinput-timeout="5000"
  input-timeout="10000"
  dtmf-interdigit-timeout="5000"
```

```

dtmf-term-timeout="10000"
dtmf-term-char=""
speech-leading-silence="300"
speech-trailing-silence="300"
speech-output-period="200"
/>

```

3.6 Utterance Manager

This element specifies parameters of the utterance manager.

Availability

>= GSR 1.3.0.

Attributes

| Name | Unit | Description |
|--------------------------|---------------------|---|
| save-waveforms | Boolean | Specifies whether to save waveforms or not. |
| purge-existing | Boolean | Specifies whether to delete existing records on start-up. |
| max-file-age | Time interval [min] | Specifies a time interval in minutes after expiration of which a waveform is deleted. Set 0 for infinite. |
| max-file-count | Integer | Specifies the max number of waveforms to store. If reached, the oldest waveform is deleted. Set 0 for infinite. |
| waveform-base-uri | String | Specifies the base URI used to compose an absolute waveform URI. |
| waveform-folder | Dir path | Specifies a folder the waveforms should be stored in. |

Parent

<umsgsr>

Children

None.

Example

The example below defines a typical utterance manager having the default parameters set.

```
<utterance-manager
  save-waveforms="false"
  purge-existing="false"
  max-file-age="60"
  max-file-count="100"
  waveform-base-uri="http://localhost/utterances/"
  waveform-folder=""
/>
```

3.7 RDR Manager

This element specifies parameters of the Recognition Details Record (RDR) manager.

Availability

>= GSR 1.3.0.

Attributes

| Name | Unit | Description |
|-----------------------|---------------------|---|
| save-records | Boolean | Specifies whether to save recognition details records or not. |
| purge-existing | Boolean | Specifies whether to delete existing records on start-up. |
| max-file-age | Time interval [min] | Specifies a time interval in minutes after expiration of which a record is deleted. Set 0 for infinite. |
| max-file-count | Integer | Specifies the max number of records to store. If reached, the oldest record is deleted. Set 0 for infinite. |
| record-folder | Dir path | Specifies a folder to store recognition details records in. Defaults to <code>\${UniMRCPIInstallDir}/var</code> . |

Parent

<umsgsr>

Children

None.

Example

The example below defines a typical utterance manager having the default parameters set.

```
<rdr-manager
  save-records="false"
  purge-existing="false"
  max-file-age="60"
  max-file-count="100"
  waveform-folder=""
/>
```

3.8 Monitoring Agent

This element specifies parameters of the monitoring agent.

Availability

>= GSR 1.3.0.

Attributes

| Name | Unit | Description |
|-----------------------|---------------------|---|
| refresh-period | Time interval [sec] | Specifies a time interval in seconds used to periodically refresh usage details. See <usage-refresh-handler>. |

Parent

<umsgsr>

Children

<usage-change-handler>

<usage-refresh-handler>

Example

The example below defines a monitoring agent with usage change and refresh handlers.

```
<monitoring-agent refresh-period="60">

  <usage-change-handler>
    <log-usage enable="true" priority="NOTICE"/>
  </usage-change-handler>

  <usage-refresh-handler>
```

```
<dump-channels enable="true" status-file="umsgsr-channels.status"/>
</usage-refresh-handler >

</monitoring-agent>
```

3.9 Usage Change Handler

This element specifies an event handler called on every usage change.

Availability

>= GSR 1.3.0.

Attributes

None.

Parent

<monitoring-agent>

Children

```
<log-usage>
<update-usage>
<dump-channels>
```

Example

This is an example of the usage change event handler.

```
<usage-change-handler>
  <log-usage enable="true" priority="NOTICE"/>
  <update-usage enable="false" status-file="umsgsr-usage.status"/>
  <dump-channels enable="false" status-file="umsgsr-channels.status"/>
</usage-change-handler>
```

3.10 Usage Refresh Handler

This element specifies an event handler called periodically to update usage details.

Availability

>= GSR 1.3.0.

Attributes

None.

Parent

<monitoring-agent>

Children

<log-usage>

<update-usage>

<dump-channels>

Example

This is an example of the usage change event handler.

```
<usage-refresh-handler>
  <log-usage enable="true" priority="NOTICE"/>
  <update-usage enable="false" status-file="umsgsr-usage.status"/>
  <dump-channels enable="false" status-file="umsgsr-channels.status"/>
</usage-refresh-handler>
```

3.11 License Server

This element specifies parameters used to connect to the license server.

Availability

>= GSR 1.2.0.

Attributes

| Name | Unit | Description |
|-------------------------|-----------|---|
| enable | Boolean | Specifies whether the use of license server is enabled or not. If enabled, the license-file attribute is not honored. |
| server-address | String | Specifies the IP address or host name of the license server. |
| certificate-file | File path | Specifies the client certificate used to connect to the license server. File name may include patterns containing a '*' sign. If multiple files match the pattern, the most recent one gets used. |
| ca-file | File path | Specifies the certificate authority used to validate the license server. |

| | | |
|----------------------|---------|--|
| channel-count | Integer | Specifies the number of channels to check out from the license server. If not specified or set to 0, either all available channels or a pool of channels will be checked based on the configuration of the license server. |
|----------------------|---------|--|

Parent

<umsgsr>

Children

None.

Example

The example below defines a typical configuration which can be used to connect to a license server located, for example, at 10.0.0.1.

```
<license-server
  enable="true"
  server-address="10.0.0.1"
  certificate-file="unilic_client_*.cert"
  ca-file="unilic_ca.crt"
/>
```

For further reference to the license server, visit

<http://unimrcp.org/licserver>

4 Configuration Steps

This section outlines common configuration steps.

4.1 Using Default Configuration

The default configuration should be sufficient for the general use.

4.2 Specifying Recognition Language

Recognition language can be specified by the client per MRCP session by means of the header field *Speech-Language* set in a *SET-PARAMS* or *RECOGNIZE* request. Otherwise, the parameter *language* set in the configuration file *umsgsr.xml* is used. The parameter defaults to *en-US*.

For supported languages and their corresponding codes, visit the following link.

<https://cloud.google.com/speech/docs/languages>

4.3 Specifying Sampling Rate

Sampling rate is determined based on the SDP negotiation. Refer to the configuration guide of the UniMRCP server on how to specify supported encodings and sampling rates to be used in communication between the client and server.

The native sampling rate with the linear16 audio encoding is used in gRPC streaming to the Google Cloud Speech service.

4.4 Specifying Speech Input Parameters

While the default parameters specified for the speech input detector are sufficient for the general use, various parameters can be adjusted to better suit a particular requirement.

- `speech-start-timeout`

This parameter is used to trigger a start of speech input. The shorter is the timeout, the sooner a *START-OF-INPUT* event is delivered to the client. However, a short timeout may also lead to a false positive.

- `speech-complete-timeout`

This parameter is used to trigger an end of speech input. The shorter is the timeout, the shorter is the response time. However, a short timeout may also lead to a false positive.

Note that both events, an expiration of the speech complete timeout and an *END-OF-SINGLE-UTTERANCE* response delivered from the Google Cloud Speech service, are monitored to trigger an end of speech input, on whichever comes first basis. In order to rely solely on an event delivered from the speech service, the parameter *speech-complete-timeout* needs to be set to a higher value.

- `vad-mode`

This parameter is used to specify an operating mode of the Voice Activity Detector (VAD) within an integer range of [0 ... 3]. A higher mode is more aggressive and, as a result, is more restrictive in reporting speech. The parameter can be overridden per MRCP session by setting the header field *Sensitivity-Level* in a *SET-PARAMS* or *RECOGNIZE* request. The following table shows how the *Sensitivity-Level* is mapped to the *vad-mode*.

| Sensitivity-Level | Vad-Mode |
|-------------------|----------|
| [0.00 ... 0.25) | 0 |
| [0.25 ... 0.50) | 1 |
| [0.50 ... 0.75) | 2 |
| [0.75 ... 1.00] | 3 |

4.5 Specifying DTMF Input Parameters

While the default parameters specified for the DTMF input detector are sufficient for the general use, various parameters can be adjusted to better suit a particular requirement.

- dtmf-interdigit-timeout

This parameter is used to set an inter-digit timeout on DTMF input. The parameter can be overridden per MRCP session by setting the header field *DTMF-Interdigit-Timeout* in a *SET-PARAMS* or *RECOGNIZE* request.

- dtmf-term-timeout

This parameter is used to set a termination timeout on DTMF input and is in effect when dtmf-term-char is set and there is a match for an input grammar. The parameter can be overridden per MRCP session by setting the header field *DTMF-Term-Timeout* in a *SET-PARAMS* or *RECOGNIZE* request.

- dtmf-term-char

This parameter is used to set a character terminating DTMF input. The parameter can be overridden per MRCP session by setting the header field *DTMF-Term-Char* in a *SET-PARAMS* or *RECOGNIZE* request.

4.6 Specifying No-Input and Recognition Timeouts

- noinput-timeout

This parameter is used to trigger a no-input event. The parameter can be overridden per MRCP session by setting the header field *No-Input-Timeout* in a *SET-PARAMS* or *RECOGNIZE* request.

- input-timeout

This parameter is used to limit input (recognition) time. The parameter can be overridden per MRCP session by setting the header field *Recognition-Timeout* in a *SET-PARAMS* or *RECOGNIZE* request.

4.7 Specifying Speech Recognition Mode

Single Utterance Mode

By default, if the configuration parameter *single-utterance* is set to true, recognition is performed in the single utterance mode and is terminated upon an expiration of the speech complete timeout or an *END-OF-SINGLE-UTTERANCE* response delivered from the Google Cloud Speech service.

Continuous Recognition Mode

In the continuous speech recognition mode, when the configuration parameter *single-utterance* is set to false, recognition is terminated upon an expiration of the speech complete timeout, which is recommended to be set in the range of 1500 msec to 3000 msec. The Google Cloud Speech service may return multiple results (sub utterances), which are concatenated and sent back to the MRCP client in a single RECOGNITION-COMPLETE event.

The parameter *single-utterance* can be overridden per MRCP session by setting the header field *Vendor-Specific-Parameters* in a *SET-PARAMS* or *RECOGNIZE* request, where the parameter name is *single-utterance* and acceptable values are *true* and *false*.

4.8 Maintaining Utterances

Saving of utterances is not required for regular operation and is disabled by default. However, enabling this functionality allows to save utterances sent to the Google Cloud Speech service and later listen to them offline.

The relevant settings can be specified via the element *utterance-manager*.

- *save-waveforms*

Utterances can optionally be recorded and stored if the configuration parameter *save-waveforms* is set to true. The parameter can be overridden per MRCP session by setting the header field *Save-Waveforms* in a *SET-PARAMS* or *RECOGNIZE* request.

- *purge-existing*

This parameter specifies whether to delete existing waveforms on start-up.

- *max-file-age*

This parameter specifies a time interval in minutes after expiration of which a waveform is deleted. If set to 0, there is no expiration time specified.

- *max-file-count*

This parameter specifies the maximum number of waveforms to store. If the specified number is reached, the oldest waveform is deleted. If set to 0, there is no limit specified.

- *waveform-base-uri*

This parameter specifies the base URI used to compose an absolute waveform URI returned in the header field *Waveform-Uri* in response to a RECOGNIZE request.

- *waveform-folder*

This parameter specifies a path to the directory used to store waveforms in. The directory defaults to `${UniMRCPIInstallDir}/var`.

4.9 Maintaining Recognition Details Records

Producing of recognition details records (RDR) is not required for regular operation and is disabled by default. However, enabling this functionality allows to store details of each recognition attempt in a separate file and analyze them later offline. The RDRs are stored in the JSON format.

The relevant settings can be specified via the element `rdr-manager`.

- `save-records`

This parameter specifies whether to save recognition details records or not.

- `purge-existing`

This parameter specifies whether to delete existing records on start-up.

- `max-file-age`

This parameter specifies a time interval in minutes after expiration of which a record is deleted. If set to 0, there is no expiration time specified.

- `max-file-count`

This parameter specifies the maximum number of records to store. If the specified number is reached, the oldest record is deleted. If set to 0, there is no limit specified.

- `record-folder`

This parameter specifies a path to the directory used to store records in. The directory defaults to `${UniMRCPIInstallDir}/var`.

4.10 Monitoring Usage Details

The number of in-use and total licensed channels can be monitored in several alternate ways. There is a set of actions which can take place on certain events. The behavior is configurable via the element `monitoring-agent`, which contains two event handlers: `usage-change-handler` and `usage-refresh-handler`.

While the `usage-change-handler` is invoked on every acquisition and release of a licensed channel, the `usage-refresh-handler` is invoked periodically on expiration of a timeout specified by the attribute `refresh-period`.

The following actions can be specified for either of the two handlers.

- `log-usage`

This action logs the number of in-use and total licensed channels. The following is a sample log statement, indicating 0 in-use and 2 total channels.

[NOTICE] GSR Usage: 0/2

- update-usage

This action writes the number of in-use and total licensed channels to a status file *umsgsr-usage.status*, located by default in the directory `${UniMRCPInstallDir}/var/status`. The following is a sample content of the status file.

```
in-use channels: 0
total channels: 2
```

- dump-channels

This action writes the identifiers of in-use channels to a status file *umsgsr-channels.status*, located by default in the directory `${UniMRCPInstallDir}/var/status`.

5 Recognition Grammars and Results

5.1 Using Built-in Speech Contexts

Pre-set built-in speech contexts can be referenced by the MRCP client in a RECOGNIZE request as follows:

```
builtin:speech/$id
```

Where *\$id* is a unique string identifier of built-in speech context.

Speech contexts are defined in the configuration file *umsgsr.xml*. A speech context is assigned a unique string identifier and holds a list of phrases which can optionally be passed to the Google Cloud Speech service to improve the recognition accuracy.

Below is a definition of a sample speech context *directory*:

```
<speech-context id="directory">
  <phrase>call Steve</phrase>
  <phrase>call John</phrase>
  <phrase>dial 5</phrase>
  <phrase>dial 6</phrase>
</speech-context>
```

Which can be referenced in a RECOGNIZE request as follows:

```
builtin:speech/directory
```

For generic speech transcription, having no speech contexts defined, a pre-set identifier *transcribe* must be used.

```
builtin:speech/transcribe
```

Note that support for speech contexts has been added since GSR 1.1.0.

5.2 Using Dynamic Speech Contexts

The MRCP client can also dynamically specify a speech context either

- in a DEFINE-GRAMMAR request by further referencing the defined speech context in a

RECOGNIZE request using the session URI scheme

- or inline in a RECOGNIZE request

While composing a DEFINE-GRAMMAR or RECOGNIZER request containing speech context definition, the following should be considered.

- The value of the header field *Content-Id* must be used as a unique string identifier of the speech context being defined.
- The value of the header field *Content-Type* must be set to *application/xml*.
- The message body must contain a definition of the speech context, composed based on the XML format of the element `<speech-context>`, specified in the configuration file *umsgsr.xml*. Note that the unique identifier of the speech context is set based on the header field *Content-Id*, as opposed to the attribute *Id* when loading from configuration.

5.3 Using Built-in DTMF Grammars

Pre-set built-in DTMF grammars can be referenced by the MRCP client in a RECOGNIZE request as follows:

```
builtin:dtmf/$id
```

Where *\$id* is a unique string identifier of the built-in DTMF grammar.

Note that only a DTMF grammar identifier *digits* is currently supported.

5.4 Retrieving Results

Results received from the Google Cloud Speech service are transformed to the NLSML format with no semantic interpretation performed and sent to the MRCP client in a *RECOGNITION-COMplete* event.

6 Usage Examples

6.1 Speech Recognition without Speech Context

This example demonstrates how to perform speech recognition by using a RECOGNIZE request, having no speech contexts defined.

C->S:

```
MRCP/2.0 336 RECOGNIZE 1
Channel-Identifier: 6e1a2e4e54ae11e7@speechrecog
Content-Id: request1@form-level
Content-Type: text/uri-list
Cancel-If-Queue: false
No-Input-Timeout: 5000
Recognition-Timeout: 10000
Start-Input-Timers: true
Confidence-Threshold: 0.87
Save-Waveform: true
Content-Length: 25

builtin:speech/transcribe
```

S->C:

```
MRCP/2.0 83 1 200 IN-PROGRESS
Channel-Identifier: 6e1a2e4e54ae11e7@speechrecog
```

S->C:

```
MRCP/2.0 115 START-OF-INPUT 1 IN-PROGRESS
Channel-Identifier: 6e1a2e4e54ae11e7@speechrecog
Input-Type: speech
```

S->C:

```
MRCP/2.0 498 RECOGNITION-COMPLETE 1 COMPLETE
Channel-Identifier: 6e1a2e4e54ae11e7@speechrecog
Completion-Cause: 000 success
Waveform-Uri: <http://localhost/utterances/utter-6e1a2e4e54ae11e7-1.wav>;size=20480;duration=1280
```

```
Content-Type: application/x-nlsml
Content-Length: 214

<?xml version="1.0"?>
<result>

    <instance>call Steve</instance>
    <input mode="speech">call Steve</input>
  </interpretation>
</result>
```

6.2 Speech Recognition with Built-in Speech Context

This example demonstrates how to perform speech recognition by using a RECOGNIZE request to reference a pre-set built-in speech context *directory* on the server.

C->S:

```
MRCP/2.0 335 RECOGNIZE 1
Channel-Identifier: 3ea18b9854af11e7@speechrecog
Content-Id: request1@form-level
Content-Type: text/uri-list
Cancel-If-Queue: false
No-Input-Timeout: 5000
Recognition-Timeout: 10000
Start-Input-Timers: true
Confidence-Threshold: 0.87
Save-Waveform: true
Content-Length: 24

builtin:speech/directory
```

S->C:

```
MRCP/2.0 83 1 200 IN-PROGRESS
Channel-Identifier: 3ea18b9854af11e7@speechrecog
```

S->C:

```
MRCP/2.0 115 START-OF-INPUT 1 IN-PROGRESS
Channel-Identifier: 3ea18b9854af11e7@speechrecog
Input-Type: speech
```

S->C:

```
MRCP/2.0 497 RECOGNITION-COMplete 1 COMPLETE
Channel-Identifier: 3ea18b9854af11e7@speechrecog
Completion-Cause: 000 success
Waveform-Uri: <http://localhost/utterances/utter-3ea18b9854af11e7-1.wav>;size=20480;duration=1280
Content-Type: application/x-nlsml
Content-Length: 213

<?xml version="1.0"?>
<result>
  <interpretation grammar="builtin:speech/directory" confidence="0.88">
    <instance>call Steve</instance>
    <input mode="speech">call Steve</input>
  </interpretation>
</result>
```

6.3 Speech Recognition with Dynamic Speech Context

This examples demonstrates how to perform speech recognition, by using a DEFINE-GRAMMAR request to specify a speech context and further reference the defined speech context in a RECOGNIZE request.

C->S:

```
MRCP/2.0 314 DEFINE-GRAMMAR 1
Channel-Identifier: 25902c3a54b011e7@speechrecog
Content-Type: application/xml
Content-Id: request1@form-level
Content-Length: 146

<speech-context>
  <phrase>call Steve</phrase>
  <phrase>call John</phrase>
  <phrase>dial 5</phrase>
  <phrase>dial 6</phrase>
</speech-context>
```

S->C:

```
MRCP/2.0 112 1 200 COMPLETE
Channel-Identifier: 25902c3a54b011e7@speechrecog
Completion-Cause: 000 success
```

C->S:

```
MRCP/2.0 305 RECOGNIZE 2
Channel-Identifier: 25902c3a54b011e7@speechrecog
Content-Type: text/uri-list
Cancel-If-Queue: false
No-Input-Timeout: 5000
Recognition-Timeout: 10000
Start-Input-Timers: true
Confidence-Threshold: 0.87
Save-Waveform: true
Content-Length: 27

session:request1@form-level
```

S->C:

```
MRCP/2.0 83 2 200 IN-PROGRESS
Channel-Identifier: 25902c3a54b011e7@speechrecog
```

S->C:

```
MRCP/2.0 115 START-OF-INPUT 2 IN-PROGRESS
Channel-Identifier: 25902c3a54b011e7@speechrecog
Input-Type: speech
```

S->C:

```
MRCP/2.0 500 RECOGNITION-COMPLETE 2 COMPLETE
Channel-Identifier: 25902c3a54b011e7@speechrecog
Completion-Cause: 000 success
Waveform-Uri: <http://localhost/utterances/utter-25902c3a54b011e7-
2.wav>;size=20480;duration=1280
Content-Type: application/x-nlsml
Content-Length: 216

<?xml version="1.0"?>
<result>
  <interpretation grammar="session:request1@form-level" confidence="0.88">
    <instance>call Steve</instance>
    <input mode="speech">call Steve</input>
```

```
</interpretation>  
</result>
```

6.4 DTMF Recognition with Built-in Grammar

This example demonstrates how to reference a built-in DTMF grammar in a RECOGNIZE request.

C->S:

```
MRCP/2.0 266 RECOGNIZE 1  
Channel-Identifier: d26bef74091a174c@speechrecog  
Content-Type: text/uri-list  
Cancel-If-Queue: false  
Start-Input-Timers: true  
Confidence-Threshold: 0.7  
Speech-Language: en-US  
Dtmf-Term-Char: #  
Content-Length: 19  
  
builtin:dtmf/digits
```

S->C:

```
MRCP/2.0 83 1 200 IN-PROGRESS  
Channel-Identifier: d26bef74091a174c@speechrecog
```

S->C:

```
MRCP/2.0 113 START-OF-INPUT 1 IN-PROGRESS  
Channel-Identifier: d26bef74091a174c@speechrecog  
Input-Type: dtmf
```

S->C:

```
MRCP/2.0 382 RECOGNITION-COMPLETE 1 COMPLETE  
Channel-Identifier: d26bef74091a174c@speechrecog  
Completion-Cause: 000 success  
Content-Type: application/x-nlsml  
Content-Length: 197  
  
<?xml version="1.0"?>
```

```
<result>
  <interpretation grammar="builtin:dtmf/digits" confidence="1.00">
    <input mode="dtmf">1 2 3 4</input>
    <instance>1234</instance>
  </interpretation>
</result>
```

6.5 Speech and DTMF Recognition

This example demonstrates how to perform recognition by activating both speech and DTMF grammars. In this example, the user is expected to input a 4-digit pin.

C->S:

```
MRCP/2.0 275 RECOGNIZE 1
Channel-Identifier: 6ae0f23e1b1e3d42@speechrecog
Content-Type: text/uri-list
Cancel-If-Queue: false
Start-Input-Timers: true
Confidence-Threshold: 0.7
Speech-Language: en-US
Content-Length: 47

builtin:dtmf/digits?length=4
builtin:speech/pin
```

S->C:

```
MRCP/2.0 83 2 200 IN-PROGRESS
Channel-Identifier: 6ae0f23e1b1e3d42@speechrecog
```

S->C:

```
MRCP/2.0 115 START-OF-INPUT 2 IN-PROGRESS
Channel-Identifier: 6ae0f23e1b1e3d42@speechrecog
Input-Type: speech
```

S->C:

```
MRCP/2.0 399 RECOGNITION-COMPLETE 2 COMPLETE
Channel-Identifier: 6ae0f23e1b1e3d42@speechrecog
```

Completion-Cause: 000 success
Content-Type: application/x-nlsml
Content-Length: 214

```
<?xml version="1.0"?>  
<result>  
  <interpretation grammar=" builtin:speech/pin" confidence="1.00">  
    <instance>one two three four</instance>  
    <input mode="speech">one two three four</input>  
  </interpretation>  
</result>
```

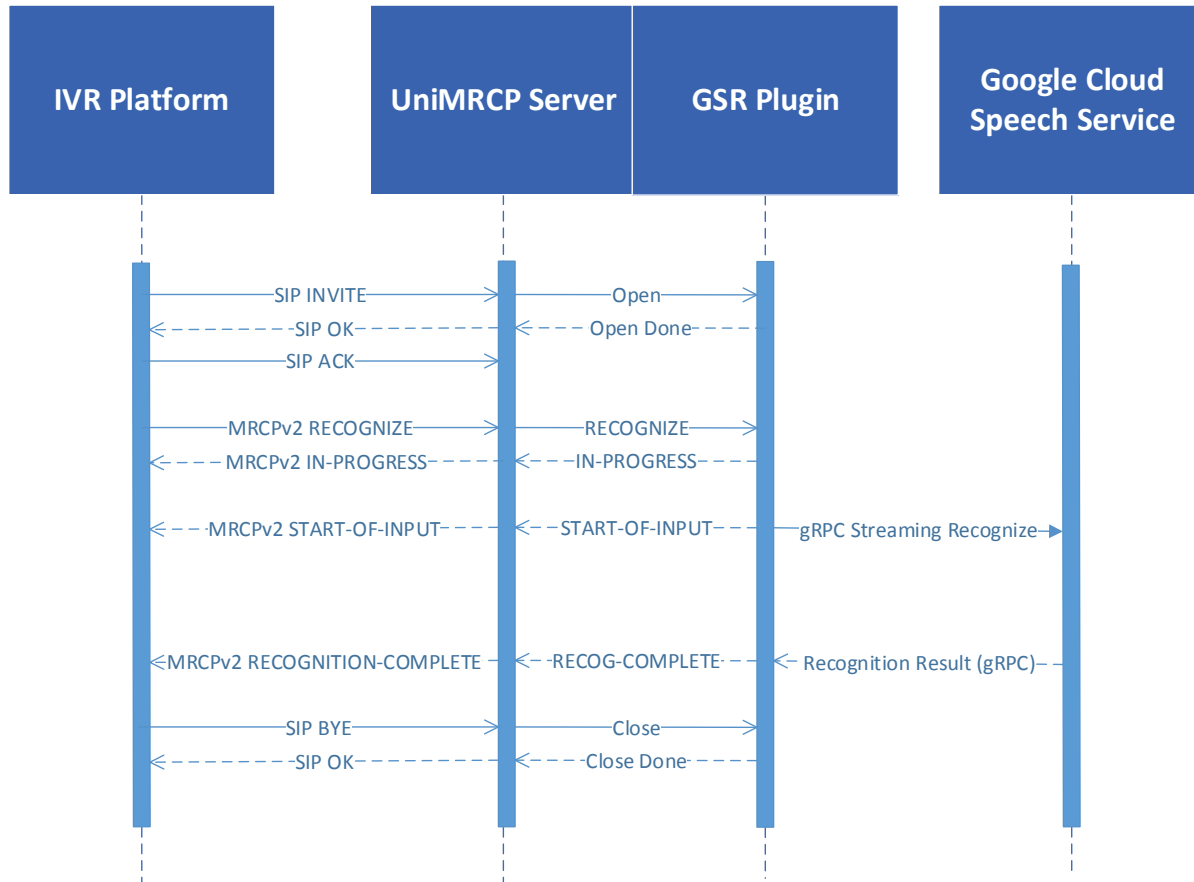

7 Sequence Diagrams

The following sequence diagrams outline common interactions between all the main components involved in a typical recognition session performed over MRCPv1 and MRCPv2 respectively.

7.1 MRCPv1

7.2 MRCPv2

8 Security Considerations

8.1 Network Connection

All the data transmitted to and received from the Google Cloud Speech API is carried over a secure TLS v1.2 connection via the gRPC streaming.

It is not even allowed to establish an unsecure connection to any of Google Cloud APIs in general.

8.2 Network Port

The standard TLS port 443 is used for the gRPC streaming,
